ABSTRACT

The NASA Goddard Mission Services Evolution Center (GMSEC) system is a message-based plug-and-play open system architecture used in many of NASA mission operations centers. This presentation will focus on the use of GMSEC standard messages to report and analyze the status of a system and enable the automation of the system's components. In GMSEC systems, each component reports its status using a keep-alive message and also publishes status and activities as log messages. In addition, the components can accept functional directive messages from the GMSEC message bus. Over the past several years, development teams have found ways to utilize these messages to create innovative display pages and increasingly sophisticated approaches to automation. This presentation will show the flexibility and value of the message-based approach to system awareness and automation.

Ground System Architecture Principles

- Different missions may have different needs
 - Do not believe in the "one size fits all" approach
 - Do believe use of common configurable products <u>as appropriate</u>
- Must allow for continual innovation
 - Must support missions that last many years
 - Missions should be able to upgrade, replace, or add components over time
- Must allow for industry participation
 - In the U.S., the commercial sector competes for available work
 - The commercial vendors are the source for much of the innovation
 - They work to have the most advanced capabilities for the fairest price
- Must have processes to promote broad use while controlling the common baseline
 - Configuration control boards, governance approach, open source distribution

GMSEC Introduction

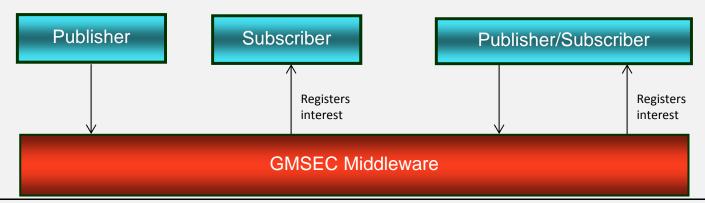

The Goddard Mission Services Evolution Center (GMSEC) is a proven satellite mission operations center <u>open architecture</u> <u>software framework</u> for use at the mission, fleet, or enterprise level.

Key Features

- Publish/Subscribe approach with standardized messages
- Supports multiple middleware products via standard API
- Allows for easy integration of many commercial and in-house products
- Encourages shared software or capabilities across organizations
- Operational since 2005, used on many missions since then

The GMSEC API is released as Open Source and we are considering the release of many of the supporting software components.

GMSEC Architecture (portions still in development)

GMSEC-Supported Middleware

- TIBCO SmartSockets
- ActiveMQ
- •IMB Websphere
- GMSEC Bolt
- Oracle Weblogic
- JMS-compatible products
- •AMQP (early 2016)

GMSEC Support Suite

[not specific to mission ops centers]

- Automation Criteria Action Table, Scripting Adapters
- Notification ANSR
- Ground Equipment Monitoring
- Event message reporting
- Remote Access Tools
- · Message trap/dsp tool
- · Environmental Monitoring
- · Performance Monitoring Tools

Mission Ops Components

GSFC AVAILABLE PRODUCTS

- •TLM/CMD
- ASIST
- ITOS
- Archive and Data Access
- DAT Data Access Toolkit
- ITPS
- •XTCE Support Suite
- Countdown Clock
- Product distribution

User/Mission Applications

Make mission tools common where appropriate

GMSEC API and Middleware with security options

- •MO Services Adapter
- •XTCE-based data generator
- Simulators
- Network front-ends

- Event/Log Message Archive and Retrieval
- GMSEC Heritage Tools

Config Files, Build/Dev Tools, Documentation

- COTS Products
 (dozens available see catalog)
- OGA Products see catalog

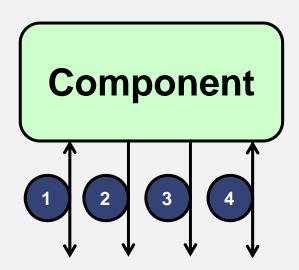

Msg Specification Doc, Level 2 Addendums Operating Systems: Microsoft Windows 7 (32 & 64 bit), Microsoft Windows 2003 Server; Red Hat 3, 4, 5 & 6 (32 bit & 64 bit); Solaris 10 Programming languages:

C, C++, Java, Perl, Python, Ruby, JavaScript

Simple Requirements for Each Component

 Must perform its designated function, using standard messages as appropriate

- 2. Must publish a keep-alive message on a regular interval
- Must report actions and events as log messages
- Must accept directive messages and generate responses

If it is a commercial component, do not create a special "GMSEC-compliant" version. Instead, develop an adapter to convert existing tool interfaces to GMSEC interfaces.

A special component also resides on each node to report status, receive directives.

GMSEC Message Subjects – Key Routable Fields

	Subject Standard	Mission Elements		Message Elements		Miscellaneous Elements			
Subject Elements	Specifi- cation	Mission	Sat ID	Туре	Subtype	me1	me2	me3	me4
	FIXED PORTION Required Elements					VARIABLE PORTION			
						Message Definition Determines Whether a Miscellaneous Element is Required or Optional			

Telemetry Message Subject Example:

GMSEC. EOS.TERRA . MSG.LOG. TLM.RT.RED.4.TLMSYS1.357

Fixed, required portion

Message dependent, variable portion

(Body of the message follows the above header)

Using the Pub/Sub Messaging Approach

The architecture enables new approach for monitoring and automation

- Can "listen" for status from all components → situational awareness
- Can direct actions of component → system-wide control
- Recognize status and respond → event-driven automation

Many types of tools can be developed to provide these capabilities

Situational Awareness

Filterable event/log message displays

Query and report tools for analyzing consolidated events logs

Spacecraft or ground system monitoring

System-Wide Control

System-wide scripting; one component can send a directive to another

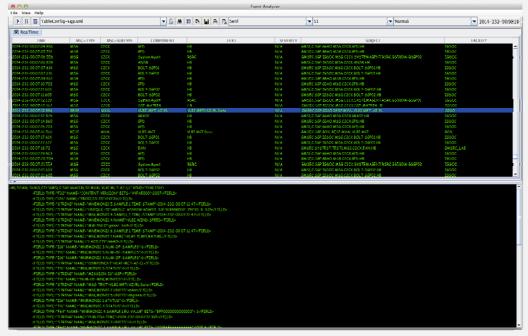

Event-Driven Automation

Rule-based analysis and action tool

GMSEC Event Message Display and Analyzer

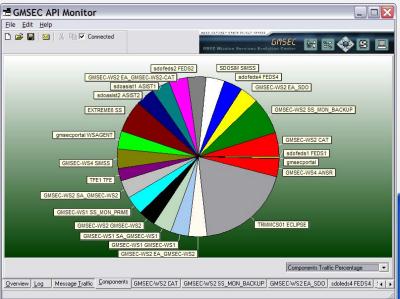

- Real-time view of message traffic on the bus
- Inspect contents of any message
- Filter view of messages
 - Declutters display
 - Focus on messages of interest
- Search messages based on topic or content
- Retrieve historical messages from GREAT database

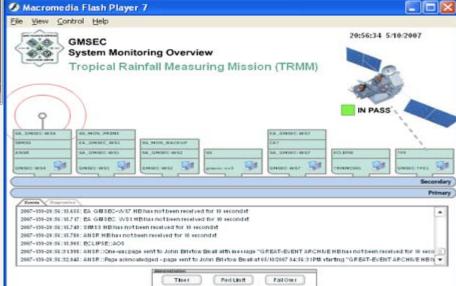

New Tools that "Listen" to the GMSEC Bus

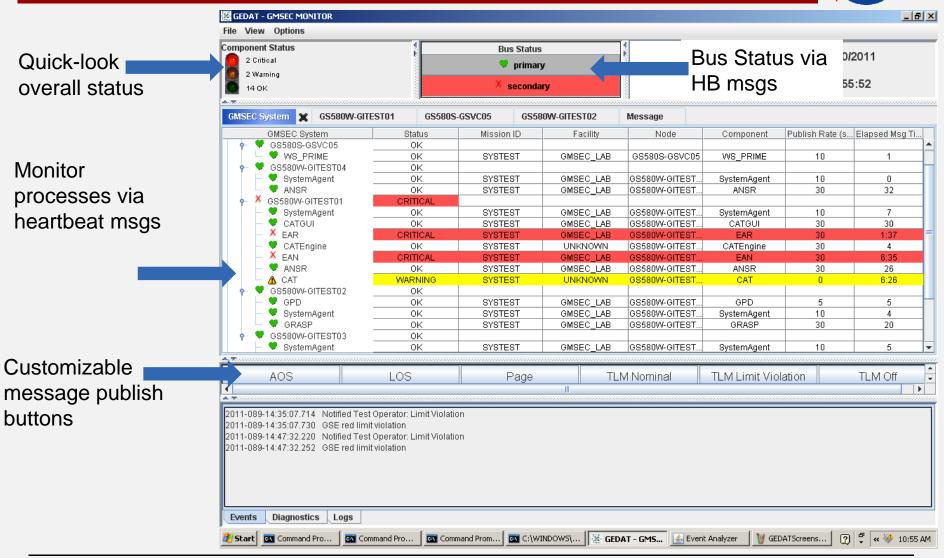

First steps. Subscribe to all messages and show their distribution.

Learning more. Subscribe to keep-alives and log messages and show actual configuration and activities as they occur.

GMSEC System Data Analysis Tool

Node Resource Monitoring

Monitor resources for selected node

Framework-enabled capabilities are still maturing

Use GMSEC messages and automation rules to show progression of flight dynamics processing steps and automate the sequence of activities and notification.

Today. Process 1,000's of messages to provide drill-down status of multiple satellites and the ground system. Fully configurable, available on mobile apps. Tested at up to 5,000 messages per second.

Automation

- Script-Driven Automation
 - Since each component can accept directives, scripts can be written to send action requests to the different software components
 - Scripts can generate or subscribe to any GMSEC message
 - Can support PERL, PYTHON, and soon will be JavaScript compliant and support RUBY and other tools
 - Example. Script to run a demo that configures simulator, telemetry system, trending system, etc.
- Event-Driven Automation
 - Can combine ability to monitor event/log status with ability to send directives.
 - Criteria Action Table (CAT) tool developed to provide event-driven automation.
 - Supports timers, variables, etc.
 - Rules can be developed by Operations Team
 - Example. Scheduler says a pass should start now, if we do not get the start of telemetry within 30 seconds, then page the shift supervisor, run the diagnostic routine, and send a message to the remote site to try again to acquire the satellite.

Automation

Another Example

 Once a pass starts, keep a list of the first 10 parameters shown to be out of limits. After the pass, wait 30 seconds, then submit an archive retrieval request for the parameters for the last 24 hours and display the plot on the large screen in the front of the room

Types of Rules

- Controlling daily activity plan
- Helping with the simple daily tasks
- Watching for anomalous behavior and responding accordingly

Advice

- Start simple
- Have several people on the team that can develop the rules
- Only automate what is repeatable and completely understood
- Rules should be configuration managed like other critical software

Final Notes

- At NASA/GSFC, missions are gaining sophistication in their use of the open, messageoriented GMSEC architecture
 - Most new missions find it much easier to integrate their new systems
 - Automation capabilities are getting more and more complex
 - Situational awareness tools are now evolving

The GMSEC architecture and software is enabling new levels of collaboration between government and industry to efficiently meet the long-term goals we all share.

The benefits of simplified integration, a broader set of available components, increased status and automation capabilities and the enabling of new operations concepts are realized through the open GMSEC architecture.
